Xcode Cloud

- Open Xcode project
- Select Cloud option in Xcode from the last option in the project navigator panel called Report navigator like in the image.
- Get started. If you have already login apple id or setup development team then you will be direct prompt to select product.
- Otherwise setup apple id and it will ask to select development team.
- Select product and hit next.(Ref next page)

Workflow

- Xcode will generate workflow same like we generate manually using Github Action .yml file.
- These workflows can be edited directly using the “**Edit Workflow**” button, where you can modify various parameters, such as the branch the workflow operates on, queue builds, distribution. In my case branch was “build” so I changed my branch. **(ref next)**
- Set workflow action like on push, pull request.
- **Post action** like Build Confirmation via slack/ email. Testing in internal or external.
- Workflow will automatic increment your build number (Version we have to change manually)

Repository Access

- Xcode will ask for grant access to your repository.
- Once you permit, you can see you app which will confirm to app store connect console.
- And that it will prompt to Start Build where you can choose branch and start you CICD.

Confirm App on App Store Connect

"[Redacted]" Developer Team
com.app.[Redacted]

Xcode Cloud builds will be associated with "[Redacted]"
[Redacted] on App Store Connect.

Build Status

- In Cloud panel you check build status success or failure.
- You can edit workflow Xcode itself OR from Xcode Cloud dashboard as well.

Thank you
